ABSTRACT

A method and system is provided for dispatching requests to processing resources. A processing resource has a current service type to process requests that have the current service type. When the processing resource is idle, it is determined whether the processing resource is to be switched to a different service type to process requests having the different service type. The processing resource is switched to the different service type when the switching is determined; and an outstanding request having the different service type is dispatched to the processing resource.
